A Program for the Solution of a Class of Geometric-analogy Intelligence-test Questions Thomas G. Evans 1964 The novel organization of the program in terms of figure descriptions, which are analyzed to find transformation rules, and rule descriptions, which are analyzed to find 'common generalizations' of pairs of transformation rules, has implications for the design of problem-solving programs and for machine learning. These implications are discussed at some length and suggestions are made for work on pattern-recognition and learning techniques based on ideas developed in the course of the present investigation.

Analogy after Aquinas Domenic D'Ettore 2018-10-31 Since the first decade of the 14th Century, Thomas Aquinas's disciples have struggled to explain and defend his doctrine of analogy. *Analogy after Aquinas: Logical Problems, Thomistic Answers* relates a history of prominent Medieval and Renaissance Thomists' efforts to solve three distinct but interrelated problems arising from their reading both of Aquinas's own texts on analogy, and from John Duns Scotus's arguments against analogy and in favor of univocity in *Metaphysics* and *Natural Theology*. The first of these three problems concerns Aquinas's at least apparently disparate statements on whether a name is said by analogy through a single concept or through diverse concepts. The second problem concerns the model of analogy suited for predicating names analogously across the categories of being or about God and creatures. Is "being" said analogously about God and creatures, or substance and accidents, on the model of how "healthy" is said of medicine and an animal, or on the model of how "principle" is said of a point and a line? The third problem comes from outside challenges to Aquinas's thought, in particular Scotus' claims that univocal names alone can mediate valid demonstrations, and any demonstration that failed to use its mediating terms univocally would fail by the fallacy of equivocation. *Analogy after Aquinas* makes a unique contribution to the study of philosophical theology in the tradition of Thomas Aquinas by showing the historical and philosophical connection between these three problems, as well as the variety of solutions proposed by leading representatives of this tradition. Thomists considered in the book include: Hervaeus Natalis (1250-1323), Thomas Sutton (1250-1315), John Capreolus (1380-1444), Dominic of Flanders (1425-1479), Paul Soncinas (d. 1494), Thomas dio vio Cajetan (1469-1534), Francis Silvestri of Ferrara (1474-1528), and Chrysostom Javelli (1470-1538).

First Time Analogies Dianne Drazé 2021-09-10 An analogy is a comparison between two things. It points out the similarities between two things that might be different in all other respects. Analogies cause us to think analytically about forms, uses, structures, and relationships. First Time Analogies is the ideal launching pad to start nonreaders on the road to real thinking experiences with these pictorial and symbolic analogies that are both challenging and motivating. The book is divided into four sections that let you introduce analogies in a developmental way. The levels are: recognizing relationships; choosing one item to complete the analogy; given two items, choosing two other items that have the same relationships; and pairing up four items to complete two related pairs. Exercises are presented on worksheets that require circling the correct answer, as well as cutting out pictures and pasting them in the correct spaces. Attractive illustrations will draw students into the engaging exercises. Although they think they are just solving fun puzzles, they will be doing serious thinking and building a basis for future experiences in critical thinking. This is the first in a series of books that introduce analogies at varying difficulties and formats. The other books are *Analogies for Beginners*, *Analogies for the 21st Century*, *Thinking Through Analogies*, and *Advancing Through Analogies*. Grades K-2
