### Minds behind the Brain : A History of the Pioneers and Their Discoveries

Department of Psychology Washington University Stanley Finger Professor 2000-03-02 Attractively illustrated with over a hundred halftones and drawings, this volume presents a series of vibrant profiles that trace the evolution of our knowledge about the brain. Beginning almost 5000 years ago, with the ancient Egyptian study of "the marrow of the skull," Stanley Finger takes us on a fascinating journey from the classical world of Hippocrates, to the time of Descartes and the era of Broca and Ramon y Cajal, to modern researchers such as Sperry. Here is a truly remarkable cast of characters. We meet Galen, a man of titanic ego and abrasive disposition, whose teachings dominated medicine for a thousand years; Vesalius, a contemporary of Copernicus, who pushed our understanding of human anatomy to new heights; Otto Loewi, pioneer in neurotransmitters, who gave the Nazis his Nobel prize money and fled Austria for England; and Rita Levi-Montalcini, discoverer of nerve growth factor, who in war-torn Italy was forced to do her research in her bedroom. For each

individual, Finger examines the philosophy, the tools, the books, and the ideas that brought new insights. Finger also looks at broader topics--how dependent are researchers on the work of others? What makes the time ripe for discovery? And what role does chance or serendipity play? And he includes many fascinating background figures as well, from Leonardo da Vinci and Emanuel Swedenborg to Karl August Weinhold--who claimed to have reanimated a dead cat by filling its skull with silver and zinc--and Mary Shelley, whose Frankenstein was inspired by such experiments. Wide ranging in scope, imbued with an infectious spirit of adventure, here are vivid portraits of giants in the field of neuroscience--remarkable individuals who found new ways to think about the machinery of the mind.

The Behavioral and Cognitive Neurology of Stroke Olivier Godefroy 2007-01-18  
The care of stroke patients has changed dramatically. As well as improvements in the emergency care of the condition, there have been marked advances in our understanding, management and rehabilitation of residual deficits. This book is about the care of stroke patients, focusing on behavioural and cognitive problems. It provides a comprehensive review of the field covering the diagnostic value of these conditions, in the acute and later phases, their requirements in terms of treatment and management and the likelihood and significance of long-term disability. This book will appeal to all clinicians involved in the care of stroke patients, as well as to neuropsychologists, other rehabilitation therapists and research scientists investigating the underlying neuroscience.

**Ela** Jacqueline Stark 1994-02-01 This German language photo series is designed for language training, teaching, testing and remediation of word-, sentence- and text/discourse- level abilities. It should be of use for comprehensive evaluation and/or training of a person's ability to produce and understand verbs, sentences and texts, to learn a vocabulary of daily-life activities, to attend to or memorize linguistic and visual material, and to order sequential

activities. A family of four persons - boy, girl, woman, man - is depicted on the photo cards, which can be used interchangeably. ELA covers activities from all areas of life, including sleeping, eating, getting washed, reading, communicating, going shopping, driving a car and swimming. On each card, a single activity is depicted, which is performed by one or two persons, or a scene is shown in which the family is doing something such as eating breakfast or playing cards. The selection of the activities is based on linguistic and psycholinguistic criteria such as sentence type, structure and complexity. Systematic use of ELA is facilitated by a practical manual, consisting of suggestions for use and indexes which are designed for specific purposes. These indexes include a listing of the verbs, i.e. activities, according to themes or semantic categories, and an alphabetical listing of the verbs with information on several linguistic features: information about the verbs and sentence structure, a list of the depicted objects, and a French and Italian translation of the verbs. A multiple-choice sentence comprehension task and a sentence production task are also given in the manual. ELA can be used for the assessment, remediation and/or training of: adults with a language or speech impairment sequel to brain damage; children with a delay in language development or a language impairment due to minimal brain damage; adults or children with other neuropsychological impairments as a sequel to brain damage; geriatric persons suffering from dementia of the Alzheimer type SDAT or from other syndromes giving rise to dementia; autistic children; hearing-impaired children and adults; and persons learning a second or a foreign language. It can also be used for psycho-linguistic evaluation of syntactic abilities of healthy persons and of children in the process of acquiring their first language.

Aphasie, sich im "Dschungel" ihrer Symptome zurechtzufinden? Wie können sie wieder am sozialen Leben teilnehmen? Das erfolgreiche Lehrbuch vermittelt alle Kenntnisse, die für die Therapie erforderlich sind...

Pragmatic Approaches to Aphasia Therapy Sergio Carlomagno 2009-04-27 The functional approach to the treatment of aphasia is embodied in the methods and techniques of Promoting Aphasic's Communicative Effectiveness (PACE), which has had an international influence on the way therapists approach the rehabilitation of aphasia patients. However, there is a shortage of research into the approach and little up-to-date practical guidance on its application. D. Carlomagno's concise book aims to provide a guide to the use and efficacy of PACE methodology which should be useful for aphasia therapists.

**The Neurocognition of Language** Colin M. Brown 2000 '... an important and captivating book, one that has been long awaited by all researchers interested in language and the brain.' Trends in Cognitive Sciences, 1999. The Neurocognition of Language brings together experts on human language and the brain to present the first critical overview of the cognitive neuroscience of language, one of the fastest-moving and most exciting areas today. In-depth discussion of the representations and structures of language, as well as of the cognitive architectures which underlie speaking, listening, and reading, will provide a basis for future brain imaging research. In addition, the existing brain imaging literature on word and sentence processing is critically reviewed, as well as contributions from brain lesion data. Finally, the book discusses the prospects and problems of brain imaging techniques for the study of language, presents some of the most recent and promising analytic procedures for relating brain imaging data to the higher cognitive functions, and contains

a review of the neuroanatomical structure of Broca's language area. Uniquely interdisciplinary, this book will provide researchers and students in cognitive neuroscience with state-of-the-art reviews of the major language functions, while being of equal interest to researchers in linguistics and language who want to learn about the neural bases of language. It will be an essential purchase for anyone requiring an overview of our current understanding of the relation between language and the brain.

*Processing of Visible Language* Paul A. Kolers 2013-11-21 The second symposium on processing visible language constituted a different "mix" of participants from the first. Greater emphasis was given to the design of language, both in its historical development and in its current display; and to practical questions associated with machine-implementation of language, in the interactions of person and computer, and in the characteristics of the physical and environmental objects that affect the interaction. Another change was that a special session on theory capped the proceedings. Psychologists remained heavily involved, however, both as contributors to and as discussants of the work presented. The motivation of the conferences remains one of bringing together graphic designers, engineers, and psychologists concerned with the display and acquisition of visible language. The papers separately tended to emphasize the one of the three disciplines that mark their authors' field of endeavor, but are constructed to be general rather than parochial. Moreover, within the three disciplines, papers emphasized either the textual or the more pictorial aspects. For example, a session on writing systems ranged from principles that seem to characterize all such systems to specific papers on ancient Egyptian writing, modern Korean, and English shorthand. The complementary session on the nontextual media opened with a discussion of general principles of pictorial communication and included papers on communicating instructions, general information, or religious belief through designs and other pictorial forms, as well as a discussion of misrepresentation.

**Alexia** Alexander Leff 2013-10-17 This book is a comprehensive review of the main acquired disorders of reading: hemianopic, pure and central alexia. The authors review the diagnostic criteria for each of the different types of disorder, and the efficacy of the therapeutic studies that have attempted to remediate them. The different theoretical models of adult reading, which largely rest on how the reading system responds to injury, are also discussed and evaluated. Focal brain injury caused by stroke and brain tumors are discussed in depth as are the effects of dementia on reading. This book starts with a chapter on normal reading, followed by chapters on hemianopic alexia, pure alexia and central alexia, each structured in the same way, with: a description of the condition; a historical review of cases to date; psychophysics; consideration of the causative lesions; evidence from functional imaging studies on patients and, most importantly, a review of the evidence base for treating each condition. Finally, there is a chapter on how patient data has informed how we think about reading. *Alexia: Diagnosis, Treatment and Theory* is aimed at neuropsychologists (both experimental and clinical), neurologists, speech therapists and others who deal with patients whose reading has been affected by an acquired brain injury, as well as interested students studying language disorders.

Textbook of Rehabilitation Medicine Michael P. Barnes 2000 Knowledge of the techniques of rehabilitation is an increasingly important component of training in a range of medical and surgical specialities. It is now recognized that rehabilitation medicine requires specific training and has evolved as a distinct medical speciality. This trend has been encouraged by the move away from acute hospital care, towards care and services delivered in the community setting. The practice of rehabilitation medicine produces real benefits, which can be measured in terms of improved function, fewer complications, better co-

ordination, cost-effectiveness and the general education of health professionals, the disabled person and their family. This text, aimed at all members of medical staff involved in the care of the disabled or handicapped patient serves to outline the underlying principles of rehabilitation medicine and provide information about the benefits of applying the relevant principles and techniques. There are chapters on the management of general physical and psychological disabilities, as well as consideration of specific disabling conditions, such as multiple sclerosis and stroke. The book also addresses the measurement of disability, its epidemiology, organizational aspects of the delivery of a rehabilitation service and introduces the concepts of the rehabilitation team and the generic rehabilitation specialist.

**Rehabilitation Goal Setting** Richard J. Siegert 2014-07-10 Written to provide clinicians, educators, researchers, and students in rehabilitation with a comprehensive overview of the theory, practice, and evidence base of goal setting, this first-of-its-kind reference provides an authoritative, state-of-the-art knowledge of the practice. The authors cover a broad range of different approaches to goal setting, with input from experts from North America, Europe, and Australia. This book is applicable to patients with stroke, traumatic brain injury, neurological disorders, spinal cord injury, and other conditions.

Cognitive Models Of Speech Processing Gerry Altmann 2013-05-24 A comprehensive review for those interested in the range of theoretical concerns in speech and language processing.

*The Neurolinguistics of Bilingualism* Franco Fabbro 2013-05-24 This book introduces the reader to both neurolinguistics per se and the neuropsychological aspects of bilingualism. Neurolinguistics may roughly be defined as a subset of neuropsychology, namely the study of the representation and processing of language in the brain. To this effect, the first chapters of the book focus on the basic neuropsychology of language processing and acquisition. The second half of the book addresses the issues of cerebral representation and processing of language in bi-or multilingual subjects. All aspects are systematically dealt with, namely the definition of bilingualism; an analysis of all the issues related to bilingual aphasia, i.e. patterns of recovery of the patients' various languages in diverse population; an investigation of the methodologies used in the study of the neuropsychological aspects of the various linguistic functions, such as comprehension, production and translation; and lastly, the issues of cerebral lateralization and neuroanatomical localization of the numerous cortical and subcortical structures subserving the various language system components in multilingual subjects. It is an excellent introduction to both the neuropsychology of language and the phenomena related to bilingualism. This book will be of

particular interest to students of language therapy, aphasiology, applied psycholinguistics, neurolinguistics and, in general, to students of medicine who wish to become more knowledgeable about the specific needs of patients in a multilingual society.

The Assessment of Bilingual Aphasia Michel Paradis 2014-03-05 The Bilingual Aphasia Test is a comprehensive language test designed to assess the differential loss or sparing of various language functions in previously bilingual individuals. The individual is tested, separately, in each language he or she previously used, and then in the two languages simultaneously. The testing is multimodal -- sampling hearing, speaking, reading, and writing; and multidimensional -- testing various linguistic levels (phonological, morphological, syntactic, lexical, and semantic), tasks (comprehension, repetition, judgment, lexical access and propositionizing), and units (words, sentences, and paragraphs). The BAT is structured as follows: \* To test a bilingual aphasic, you will need the following testing elements: the stimulus books for each of the languages in which the individual was formerly fluent, the single-language tests for each of these languages, as well as the bilingual test that links them. For example, if you are testing an English-French bilingual aphasic, you will need an English stimulus book, a French stimulus book, an English single-language test, a French single-language test, and an English-French bilingual test. \* The BAT can also be used to test monolingual aphasics. To test for monolingual aphasia, you will need the stimulus book and the single-language test in the language in which the individual was formerly fluent. \* Professor Paradis' book, *The Assessment of Bilingual Aphasia*, provides the background material and serves as the manual for the test. The BAT is available in dozens of languages and language pairs. There are now 106 bilingual pairs available. Additional single-language and bilingual tests are being prepared continuously. If the language (or language pair) you need is not listed, please call LEA to find out if and when it will be available. Biological Perspectives on Language David Caplan 1984 Profoundly influenced by the analyses, of contemporary linguistics, these original contributions bring a number of different views to bear on important issues in a controversial area of study. The linguistic structures and language-related processes the book deals with are for the most part central (syntactic structures, phonological representations, semantic readings) rather than peripheral (acousticphonetic structures and the perception and production of these structures) aspects of language. Each section contains a summarizing introduction. Section I takes up issues at the interface of linguistics and neurology: The Concept of a Mental Organ for Language; Neural Mechanisms, Aphasia, and Theories of Language; Brain-based and Non-brain-based Models of Language; Vocal Learning and Its Relation to Replaceable Synapses and Neurons. Section II presents linguistic and psycholinguistic issues: Aspects of Infant Competence and the Acquisition of Language; the Linguistic Analysis of Aphasic Syndromes; the Clinical Description of Aphasia (Linguistic Aspects); The Psycholinguistic Interpretation of Aphasias; The Organization of Processing Structure for Language Production; and The Neuropsychology of Bilingualism. Section III deals with neural issues: Where is the Speech Area and Who has Seen It? Determinants of Recovery from Aphasia; Anatomy of Language; Lessons from Comparative Anatomy; Event Related Potentials and Language; Neural Models and Very Little About Language. David Caplan, M.D. edited *Biological Studies of Mental Processes* (MIT Press 1980), and is a member of the editorial staff of two prestigious journals, *Cognition* and *Brain & Behavioral Sciences*, He works at the Montreal Neurological Institute. André Roch Lecours is Professor of Neurology and Allan Smith Professor of Physiology, both at the University of Montreal. The book is in the series, *Studies in Neuropsychology and Neurolinguistics*.
