A Plato Reader Plato 2012-09-15 A Plato Reader offers eight of Plato's best-known works--Euthyphro, Apology, Crito, Meno, Phaedo, Symposium, Phaedrus, and Republic--unabridged, expertly introduced and annotated, and in widely admired translations by C. D. C. Reeve, G. M. A. Grube, Alexander Nehamas, and Paul Woodruff. The collection features Socrates as its central character and a model of the examined life. Its range allows us to see him in action in very different settings and philosophical modes: from the elenctic Socrates of the Meno and the dialogues concerning his trial and death, to the erotic Socrates of the Symposium and Phaedrus, to the dialectician of the Republic. Of Reeve's translation of this final masterpiece, Lloyd P. Gerson writes, "Taking full advantage of S. R. Slings' new Greek text of the Republic, Reeve has given us a translation both accurate and limpid. Loving attention to detail and deep familiarity with Plato's thought are evident on every page. Reeve's brilliant decision to cast the dialogue into direct speech produces a compelling impression of immediacy unmatched by other English translations currently available."

Who Medical Eligibility Criteria Wheel for Contraceptive Use World Health Organization 2015-08-25 Family planning allows people to attain their desired number of children and determine the spacing of pregnancies. It is achieved through use of contraceptive methods and the treatment of infertility. Promotion of family planning--and ensuring access to preferred contraceptive methods for women and couples--is essential to securing the well-being and autonomy of women, while supporting the health and development of communities. Family planning / contraception is key to slowing unsustainable population growth and the resulting negative global impacts on the economy, environment, and national and regional development efforts. It follows therefore that safe contraceptive methods need to be available to as many women as possible, including those that have a pre-existing medical condition. WHO's Medical Eligibility Criteria for Contraceptive Use, which was first published in 1996, provides family planning providers with guidance on helping those living with medical conditions to find a contraceptive method that works for them. For each medical condition or medically relevant characteristic, contraceptive methods are placed into one of four numbered categories. Category 1. A condition for which there is no restriction for the use of the contraceptive method Category 2. A condition where the advantages of using the method generally outweigh the theoretical or proven risks Category 3. A condition where the theoretical or proven risks usually outweigh the advantages of using the method Category 4. A condition which represents an unacceptable health risk if the contraceptive method is used. This simple classification enables family planning providers to provide contraception safely to women (and men) who previously may have been excluded from methods because of a lack of clinical guidance.

Immunization Safety Review Institute of Medicine 2004-02-20 Infection with the influenza virus can have a serious effect on the health of people of all ages, although it is particularly worrisome for infants, the elderly, and people with underlying heart or lung problems. A vaccine exists (the "flu" shot) that can greatly decrease the impact of influenza. Because the strains of virus that are expected to cause serious illness and death are slightly different every year, the vaccine is also slightly different every year and it must be given every year, unlike other vaccines. The Immunization Safety Review committee

reviewed the data on influenza vaccine and neurological conditions and concluded that the evidence favored rejection of a causal relationship between influenza vaccines and exacerbation of multiple sclerosis. For the other neurological conditions studied, the committee concluded the evidence about the effects of influenza vaccine is inadequate to accept or reject a causal relationship. The committee also reviewed theories on how the influenza vaccine could damage the nervous system. The evidence was at most weak that the vaccine could act in humans in ways that could lead to these neurological problems.

The Premonition: A Pandemic Story Michael Lewis 2021-05-04 New York Times Bestseller For those who could read between the lines, the censored news out of China was terrifying. But the president insisted there was nothing to worry about. Fortunately, we are still a nation of skeptics. Fortunately, there are those among us who study pandemics and are willing to look unflinchingly at worst-case scenarios. Michael Lewis's taut and brilliant nonfiction thriller pits a band of medical visionaries against the wall of ignorance that was the official response of the Trump administration to the outbreak of COVID-19. The characters you will meet in these pages are as fascinating as they are unexpected. A thirteen-year-old girl's science project on transmission of an airborne pathogen develops into a very grown-up model of disease control. A local public-health officer uses her worm's-eye view to see what the CDC misses, and reveals great truths about American society. A secret team of dissenting doctors, nicknamed the Wolverines, has everything necessary to fight the pandemic: brilliant backgrounds, world-class labs, prior experience with the pandemic scares of bird flu and swine flu...everything, that is, except official permission to implement their work. Michael Lewis is not shy about calling these people heroes for their refusal to follow directives that they know to be based on misinformation and bad science. Even the internet, as crucial as it is to their exchange of ideas, poses a risk to them. They never know for sure who else might be listening in.

diagnosis of hepatitis B (HBV) and C (HCV) infection is the gateway for access to both prevention and treatment services, and is a crucial component of an effective response to the hepatitis epidemic. Early identification of persons with chronic HBV or HCV infection enables them to receive the necessary care and treatment to prevent or delay progression of liver disease. Testing also provides an opportunity to link people to interventions to reduce transmission, through counselling on risk behaviors and provision of prevention commodities (such as sterile needles and syringes) and hepatitis B vaccination. These are the first WHO guidelines on testing for chronic HBV and HCV infection and complement published guidance by WHO on the prevention, care and treatment of chronic hepatitis C and hepatitis B infection. These guidelines outline the public health approach to strengthening and expanding current testing practices for HBV and HCV, and are intended for use across age groups and populations.
