Industrial Robot Handbook Richard K. Miller 2013-11-21 These are exciting times for manufacturing engineers. It has been said that American industry will undergo greater changes during the 1980 and 1990 decades than it did during the entire eight preceding decades of this century. The industrial robot has become the symbol of this progress in computer-integrated manufacturing. This book is for engineers and managers in manufacturing industries who are involved in implementing robotics in their operations. With tens of thousands of industrial robots already in use in the United States, there are plenty of role models for proposed applications to be patterned after. This book provides an overview of robot applications and presents case histories that might suggest applications to engineers and managers for implementation in their own facilities. The application of industrial robots were well developed in the late 1970s and early 1980s. While the reader may note some of the examples discussed in this handbook incorporate older robot models, it is the application that is of interest. As Joseph Engelberger, the founding father of robotics has pointed out, industrial robots in 1988 are "doing pretty much the same kind of work" as they did in 1980.

Computer Aided Process Planning (CAPP) Architecture Technology Corpor 2016-07-29 Please note this is a Short Discount publication. Process planning involves creating detailed plans of the manufacturing steps and equipment necessary to produce a finished part. Using the variant method, CAPP groups families of parts by a structured classification and coding plan. This report summarizes the state–of–the–art and future trends in the area of CAPP. The computer is a vital part of the process planning function, which includes two different approaches. One is called the variant (similar part) method of process planning and the other is generative (expert system–based). Both will produce similar process plans. Most computer applications, however, are of the variant type, because the software is easier to develop and new process plans are based on previous ones.

Numerical Control Lathe Language Study Peter D. Senkiw 1979 An examination of fifteen numerically controlled lathe programming systems was conducted to characterize them qualitatively and quantitatively. The report presents a description of each of the fifteen voluntary participants' systems. The report: describes the non-technical characteristics of each system--the business and operational characteristics such as hardware and software sources and costs, documentation, training, vendor support and maintenance; tabulates the capabilities of the languages for description of the geometrical configurations of the part being programmed, and the variety of the geometrical formats accepted by each system as manuscript statements; discusses the use of macros to simplify the writing of programs to perform the common operations of all lathe work--automatic roughing, finishing along a profile, threading, grooving and necking, drilling, boring, reaming and tapping; presents a brief discussion of the distinguishing characteristics of each system; describes the preparation of ten test parts for use in demonstrating the capabilities of the fifteen systems; describes the capabilities demonstrated by the fifteen systems to program the ten test parts; the amount of time required to write the program, and to debug it; it shows the success in processing and postprocessing the program, and the verification of the output tape.
