Imaging Anatomy of the Human Spine Scott E. Forseen, MD 2015-12-17 An Atlas for the 21st Century The most precise, cutting-edge images of normal spinal anatomy available today are the centerpiece of this spectacular atlas for clinicians, trainees, and students in the neurologically-based medical specialties. Truly an atlas for the 21st century, this comprehensive visual reference presents a detailed overview of spinal anatomy acquired through the use of multiple imaging modalities and advanced techniques that allow visualization of structures not possible with conventional MRI or CT. A series of unique full-color structural images derived from 3D models based on actual images in the book further enhances understanding of spinal anatomy and spatial relationships. Written by two neuroradiologists who are also prominent educators, the atlas begins with a brief introduction to the development, organization, and function of the human spine. What follows is more than 650 meticulously presented and labelled images acquired with the full complement of standard and advanced modalities currently used to visualize the human spine and adjacent structures including x-ray, fluoroscopy, MRI, CT, CTA, MRA, digital subtraction angiography, and ultrasound of the neonatal spine. The vast array of data that these modes of imaging provide offer a wider window into the spine and allow the reader an unobstructed view of the anatomy presented to inform clinical decisions or enhance understanding of this complex region. Additionally, various anatomic structures can be viewed from modality to modality and from multiple planes. This state-of-the-art atlas elevates conventional anatomic spine topography to the cutting edge of technology. It will serve as an authoritative learning tool in the classroom, and as a crucial practical resource at the workstation or in the office or clinic. Bobath Concept Sue Raine 2013-05-09 Authored by members of the British Bobath Tutors Association, Bobath Concept: Theory and Clinical Practice in Neurological Rehabilitation is a practical illustrated guide that offers a detailed exploration of the theoretical underpinning and clinical interventions of the Bobath Concept. The evolution of the Bobath concept is brilliantly captured in this volume. The recognition that the best inhibition may come from engaging the patient in normal activities is an example of the way one of the notions central to the original Bobath Concept has developed. In short, the Bobath Concept lies at the heart of an approach to neurorehabilitation that is ready to take advantage of the rapidly advancing understanding, coming from neuroscience, of brain function in, in particular, of the effects of and responses to damage, and the factors that may drive recovery. It is no coincidence that neuroplasticity figures so prominently in the pages that follow.' Emeritus Professor Raymond Tallis BM BCh BA FRCP FMedSci LittD DLitt FRSA This book guides the reader through general principles to more specific application of neurophysiological principles and movement re-education in the recovery of important areas, including moving between sitting and standing, locomotion and recovery of upper limb function. Bobath Concept: Theory and Clinical Practice in Neurological Rehabilitation will be invaluable to undergraduate and qualified physiotherapists /occupational therapists and all professionals working in neurological rehabilitation. Covers the theoretical underpinning of the Bobath Concept. Presents a holistic, 24-hour approach to functional recovery. Focuses on efficient movement and motor learning, to maximise function. Forges links between theory and clinical practice. Illustrated throughout.

ICPC-3 International Classification of Primary Care Kees van Boven 2021-12-28 This third edition of the International Classification of Primary Care (ICPC-3) is indispensable for anyone wishing to use the international classification system for classification of morbidity data in a primary care setting. Distilling the many standards that are applied internationally in primary & community care and public health to offer a telescopic view, the classification has been completely rewritten to reflect the continued shift in the health paradigm of primary care and public health towards the person rather than the disease or provider. The content of ICPC-3 remains closely 'linked' to relevant related international classifications. The ICPC-3 also contributes to the United Nations' Sustainable Development Goals, specifically to Goal 3 and its target of ensuring healthy lives and promoting well-being for all at all ages.

Microneuroanatomy and Surgery Feres Chaddad-Neto 2022 *Microneuroanatomy* is essential to understanding the brain. In many cases, passing on neuroanatomical knowledge is a difficult task to accomplish, yet this is chiefly due to those who are tasked with conveying this knowledge in classes and lectures, or in books. In reality, neuroanatomy is simple and needs to be understood as a tool for approaching the different areas of the brain, not as an obstacle, and the only way to overcome this problem is to correlate neuroanatomy with various types of disease (arteriovenous malformations, aneurysms, tumors, cavernomas, hydrocephalus, etc.) This book provides a novel approach to the relation between microneuroanatomy and brain diseases. Each chapter addresses a specific neuroanatomical region, and correlates all the key neuroanatomical aspects with diseases that affect it; further, each chapter provides detailed insights into safely performing brain surgery in the respective region.

Theoretical Biomechanics Vaclav Klika 2011-11-25 During last couple of years there has been an increasing recognition that problems arising in biology or related to medicine really need a multidisciplinary approach. For this reason some special branches of both applied theoretical physics and mathematics have recently emerged such as biomechanics, mechanobiology, mathematical biology, biothermodynamics. This first section of the book, General notes on biomechanics and mechanobiology, comprises from theoretical contributions to Biomechanics often providing hypothesis or rationale for a given phenomenon that experiment or clinical study cannot provide. It deals with mechanical properties of living cells and tissues, mechanobiology of fracture healing or evolution of locomotor trends in extinct terrestrial giants. The second section, Biomechanical modelling, is devoted to the rapidly growing field of biomechanical models and modelling approaches to improve our understanding about processes in human body. The last section called Locomotion and joint biomechanics is a collection of works on description and analysis of human locomotion, joint stability and acting forces.
