*Envisioning the National Health Care Quality Report* Institute of Medicine 2001-04-22 How good is the quality of health care in the United States? Is quality improving? Or is it suffering? While the average person on the street can follow the state of the economy with economic indicators, we do not have a tool that allows us to track trends in health care quality. Beginning in 2003, the Agency for Healthcare Research and Quality (AHRQ) will produce an annual report on the national trends in the quality of health care delivery in the United States. AHRQ commissioned the Institute of Medicine (IOM) to help develop a vision

for this report that will allow national and state policy makers, providers, consumers, and the public at large to track trends in health care quality. Envisioning the National Health Care Quality Report offers a framework for health care quality, specific examples of the types of measures that should be included in the report, suggestions on the criteria for selecting measures, as well as advice on reaching the intended audiences. Its recommendations could help the national health care quality report to become a mainstay of our nation's effort to improve health care.

Registries for Evaluating Patient Outcomes Agency for Healthcare Research and Quality/AHRQ 2014-04-01 This User's Guide is intended to support the design, implementation, analysis, interpretation, and quality evaluation of registries created to increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for one or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been exposed to biopharmaceutical products or medical devices. Health services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User's Guide was created by researchers affiliated with AHRQ's Effective Health Care Program, particularly those who participated in AHRQ's DEcIDE (Developing Evidence to Inform Decisions About Effectiveness) program. Chapters were subject to multiple internal and external independent reviews.

**Health Systems Improvement Across the Globe** Jeffrey Braithwaite 2017-08-07 Following on from 2015's Healthcare Reform, Quality and Safety: Perspectives, Participants, Partnerships and Prospects in 30 Countries, this book encompasses a global perspective on healthcare while shifting the focus from reform to showcasing success stories of healthcare systems worldwide. It provides explanations of why various facets of healthcare systems work well in different contexts and offers the reader alternative models for consideration. The book features contributions from 60 countries, going much further than the common practice of

focusing on affluent Western nations, to provide a comprehensive exploration of the success of healthcare systems globally. The majority of literature on health-sector improvement attempts to address the problems within systems, relating the errors that can and do occur, for example, and offering solutions and preventative strategies. This book of country case studies will approach the enhancement of health systems, patient safety and the quality of care in a new and innovative way, comprehensively surveying and synthesizing the success stories of healthcare systems around the world, utilizing Hollnagel's Safety-II approach to acknowledge the importance of exploring what goes right, what works well, and why it works. These success stories may include reference to macro, meso or micro levels of healthcare systems, various sectors (e.g., aged care, acute care or primary care), or specific programs or projects. *Health System Improvement Across the Globe: Success Stories from 60 Countries* is unprecedented in terms of both reach and positive emphasis, and as such will be instrumental in changing ways of thinking about and guiding health-sector improvement.

important and sometimes controversial questions about the collection, quality, and appropriate use of health care data. Based on experience with databases now in operation and in development, Health Data in the Information Age provides a clear set of guidelines and principles for exploiting the potential benefits of aggregated health data--without jeopardizing confidentiality. A panel of experts identifies characteristics of emerging health database organizations (HDOs). The committee explores how HDOs can maintain the quality of their data, what policies and practices they should adopt, how they can prepare for linkages with computer-based patient records, and how diverse groups from researchers to health care administrators might use aggregated data. Health Data in the Information Age offers frank analysis and guidelines that will be invaluable to anyone interested in the operation of health care databases.
