Disability Politics Jane Campbell 2013-01-11 This powerful book presents a series of perspectives on the process of self-organisation of disabled people which has taken place over the last thirty years. The 1980s saw a transformation in our understanding of the nature of disability, and consequently the kinds of policies and services necessary to ensure the full economic and social integration of disabled people. At the heart of this transformation has been the rise in the number of organisations controlled and run by disabled people themselves. Through a series of interviews with disabled people who have been centrally involved in the rise of the disability movement, the authors present a new collective history which throws light on the politics of the 1980s, and offers insights into future political developments in the 1990s and on into the twenty-first century.

The Embryology of the Human Locomotor System Hans K. Uthoff 2012-12-06 In this Atlas I want to share with my fellow clinicians the fascina tion I experienced while discovering the marvels of embryonic development. Why haven't these marvels excited me before? I believe that the use of schemata and drawings or photographs of animal embryos, commonly used in textbooks of embryology, simply did not appeal to me as a clinician. Only actual photo graphs of human embryos can establish the bond necessary for interaction. Just imagine the excitement when you find out how many struc tures you can recognize in a 5-week-old embryo, barely measuring 1 cm in length. But our fascination does not stop here. The pro gression of changes taking place during the next 3 weeks is so rapid that at the time when the embryo measures 3 cm, all structures familiar to us are not only easily recognizable, but also already in their anatomical position. How can we hide our amazement when we realize that such a state of perfection is present in an embryo a bit longer than the distal phalanx of our little finger? At 8 weeks the embryonic period ends and the fetal one starts. Although the shape and the relative size of bones, joints, muscles, nerves, and vessels will undergo changes, the basic elements are all in place. This implies that major malformations must develop during the embryonic period.

Drug Therapy for the Elderly Martin Wehling 2012-08-17 With people aged 65 years and older currently making up the fastest growing age group throughout the world, the demographic revolution of an aging society will inevitably lead to increased pressure to develop a rationalistic and age-tailored process of diagnosis and treatment among the elderly. As aging people often suffer from several chronic diseases and are being treated with multiple medications concurrently, unwanted drug interactions occur more frequently. Whereas recent approaches have recommended to remove particular drugs from the medication regimen to avoid adverse effects, Drug Therapy for the Elderly underlines both indispensable and dispensable elements of drug treatment in order to provide an overall assessment of drugs suitable for the aged. In view of the multimorbidity and polypharmacy situations experienced by elderly patients, this book takes into account the special needs and requirements shown by this group, thus serving as a timely reference for physicians who treat the elderly.

Body Composition and Aging C.V. Mobbs 2010-08-12 Increased adiposity and decreased muscle mass contribute substantially to age-dependent disease and disability. In particular age-related increase in adiposity is quickly becoming a major threat to public health throughout the world. Although the hypothesis that age-related changes in body composition are due to lifestyle choices alone is well accepted, it is a vast oversimplification. This volume reflects the current knowledge in this rapidly developing field of research. The first part of the book discusses the extent to which increased adiposity contributes to age-related diseases and longevity. The 'obesity paradox', describing the protective role of overweight in decreasing mortality while increasing pathology, is covered in depth. Further chapters address specific aspects of the regulation of energy balance during aging, including the effects of changes in food intake. Finally the causes and consequences of loss of muscle mass and age-related osteoporosis are examined. A valuable help for physicians treating elderly patients, this book will also be of great interest to researchers studying energy balance, muscle physiology, bone disease, and other aspects of aging.

At this moment in time, the developments in the

field of modern nanotechnology provide amazing success stories, such as the possibility for reconstructing surface structures for industrial materials that are demonstrated to us in nature. The reader will receive an overview of coatings systems based on the application of chemical nanotechnology. Practitioners will be given an introduction to nanostructured coatings and experts will find the account of various silanebased materials useful.

International Perspectives on Spinal Cord Injury World Health Organization 2013 "Every year between 250 000 and 500 000 people suffer a spinal cord injury, with road traffic crashes, falls and violence as the three leading causes. People with spinal cord injury are two to five times more likely to die prematurely. They also have lower rates of school enrollment and economic participation than people without such injuries. Spinal cord injury has costly consequences for the individual and society, but it is preventable, survivable and need not preclude good health and social inclusion. Ensuring an adequate medical and rehabilitation response, followed by supportive services and accessible environments, can help minimize the disruption to people with spinal cord injury and their families. The aims of International perspectives on spinal cord injury are to: --assemble and summarize information on spinal cord injury, in particular the

epidemiology, services, interventions and policies that are relevant, together with the lived experience of people with spinal cord injury; --make recommendations for actions based on this evidence that are consistent with the aspirations for people with disabilities as expressed in the Convention on the Rights of Persons with Disabilities.

Clinical Neurodynamics Michael O. Shacklock 2005 Applies and modifies Maitland techniques to neural mobilization, refining and improving practical skills for clinical physiotherapists and physically-based occupational therapists. The text outlines the concept of neurodynamics and the basic mechanisms in movement of the nervous system and describes what can go wrong. Causal mechanisms are linked to diagnosis and treatment of pain and musculoskeletal problems in a systematic way. Various treatment techniques for each diagnostic category are presented and applied to specific clinical problems such as neck pain, headache, tennis elbow, carpal tunnel syndrome, low back pain to name a few. These are common problems in which therapists often miss a neural component.
