**The Man with Many Lives** Robert W. Day FSO Retired 2019-10-30 Born in 1919, Robert W. (Bob) Day looks back on the ten decades of his lifetime with wonder and gratitude. While recognition and

accolades for jobs well done followed him throughout his life, it was the adventures and the family, friends, and co-workers with whom he shared those adventures, that he remembers most. As a youngster, Bob never expected his life beyond Leavenworth, Kansas to be full of life threatening moments nor moments of serene beauty stretching over four continents, but it was. He never imagined warding off machine-gun-weilding revolutionaries, poisonous mambo snakes, nor a Prince intent on buying his daughter, but he did. He would have been surprised to know that more than once he would face death in a failing airplane, and live to tell the tale. Bob recalls all this and more as he celebrates his 100 years of an adventurous life. Here, in his own words, is Bob's story as he remembers it in 2019.

Graph-theoretic Techniques for Web Content Mining Adam Schenker 2005 This book describes exciting new opportunities for utilizing robust graph representations of data with common machine learning algorithms. Graphs can model additional information which is often not present in commonly used data representations, such as vectors. Through the use of graph distance ? a relatively new approach for determining graph similarity ? the authors show how well-known algorithms, such as k-means clustering and k-nearest neighbors classification, can be easily extended to work with graphs instead of vectors. This allows for the utilization of additional information found in graph representations, while at the same time employing well-known, proven algorithms. To demonstrate and investigate these novel techniques, the authors have selected the domain of web content mining, which involves the clustering and classification of web documents based on their textual substance. Several methods of representing web document content by graphs are introduced; an interesting feature of these representations is that they allow for a polynomial time distance computation, something which is typically an NP-complete problem when using graphs. Experimental results are reported for both clustering and classification in three web document collections using a variety of graph representations, distance measures, and algorithm parameters. In addition, this book describes several other related topics, many of which provide excellent starting points for researchers and students interested in exploring this new area of machine learning further. These topics include creating graph-based multiple classifier ensembles through random node selection and visualization of graph-based data using multidimensional scaling.

Contract Management Systems Jack Sternbach 1990 This synthesis will be of interest to administrators, contract officers, and others interested in using consulting firms to manage a transportation agency's work activities -- ranging from a single project to a complete spectrum of work. Information is provided on various aspects of contract management systems, including examples of use of each aspect in several agencies. An increasing workload coupled with reduced staff size have caused state highway agencies to turn to private enterprise to accomplish work that has traditionally been done in-house. This report of the Transportation Research Board describes various aspects of the use of consultants to manage a highway agency's work and gives specific examples of use of each aspect in several agencies.
