*Carlo Crivelli* R. W. Lightbown 2004-01-01 Venetian artist Carlo Crivelli (c. 1430-1495) is a painter whose individuality of style and mastery of powerful line have fascinated many, but whose life and art have remained enigmatic. This absorbing book, drawing on extensive research in Venice and the Marches, the region of central Italy that Crivelli dominated artistically from 1468 until his death, examines his paintings in depth and traces the fundamental influences of the Vivarini, of Squarcione and Mantegna, and later of Flemish art. Ronald Lightbown, eminent historian of Italian Renaissance art, interweaves stylistic and iconographical analysis of Crivelli's work with historical and cultural background. The author uncovers the reasons that led patrons to choose the saints that figured in Crivelli's altarpieces, discusses the initiations of new cults and the devising of an iconography for them, and demonstrates Crivelli's independence from clerical dictation in the symbolism of his still-life pictures.

**Introduction to Information Retrieval** Christopher D. Manning 2008-07-07 Class-tested and coherent, this textbook teaches classical and web information retrieval, including web search and the related areas of text classification and text clustering from basic concepts. It gives an up-to-date treatment of all aspects of the design and implementation of systems for gathering, indexing, and searching documents; methods for evaluating systems; and an introduction to the use of machine learning methods on text collections. All the important ideas are explained using examples and figures, making it perfect for introductory courses in information retrieval for advanced undergraduates and graduate students in computer science. Based on feedback from extensive classroom experience, the book has been carefully structured in order to make teaching more natural and effective. Slides and additional exercises (with solutions for lecturers) are also available through the book's supporting website to help course instructors prepare their lectures.

**In the Metro** Marc Augé 2002 Tourists climb the Eiffel Tower to see Paris. Parisians know that to really see the city you must descend into the metro. In this revelatory book, Marc Augé takes readers below Paris in a work that is both an ethnography of the city and a personal narrative. Guiding us through history, memory, and physical space, Augé juxtaposes the romance of the metro with the reality of multiethnic urban France. His work is part autobiography, with impressions from a lifetime riding the trains; part meditation on self and memory reflected in the people and places underneath Paris; part analysis of a place where the third world and the first world meet, where remnants of cultures move and press together; and part a reflection on anthropology in an era of globalization and urban development. Although he is a pillar of French thought, *In the Metro* is Augé's first major critical and creative work translated into English. It shows him to be firmly rooted in a tradition of literary ethnography that reaches back to Claude Lévi-Strauss and Michel de Certeau, but also engaged in current theoretical debates in literary and cultural studies. In Augé's idiosyncratic and innovative approach, the act of observing the quotidian is elevated to an art. The writer and his history become part of the field he observes, and anthropology interacts with a site -- urban life -- usually reserved for sociology and cultural studies. Throughout, Augé reveals a passion for his milieu, seeing the metro as a place rich with history and literature -- an eclectic egalitarian society.

Introduction to Optical Quantum Information Processing Pieter Kok 2010-04-22 Quantum information processing offers fundamental improvements over classical information processing, such as computing power, secure communication, and high-precision measurements. However, the best way to create practical devices is not yet known. This textbook describes the techniques that are likely to be used in implementing optical quantum information processors. After developing the fundamental concepts in quantum optics and quantum information theory, the book shows how optical systems can be used to build quantum computers according

to the most recent ideas. It discusses implementations based on single photons and linear optics, optically controlled atoms and solid-state systems, atomic ensembles, and optical continuous variables. This book is ideal for graduate students beginning research in optical quantum information processing. It presents the most important techniques of the field using worked examples and over 120 exercises.
