Business Process Management Mathias Weske 2019-06-22 Business process management is usually treated from two different perspectives: business administration and computer science. While business administration professionals tend to consider information technology as a subordinate aspect in business process management for experts to handle, by contrast computer science professionals often consider business goals and organizational regulations as terms that do not deserve much thought but require the appropriate level of abstraction. Matthias Weske argues that all communities involved need to have a common understanding of the different aspects of business process management. To this end, he details the complete business process lifecycle from the modeling phase to process enactment and improvement, taking into account all different stakeholders involved. After starting with a

presentation of general foundations and abstraction models, he explains concepts like process orchestrations and choreographies, as well as process properties and data dependencies. Finally, he presents both traditional and advanced business process management architectures, covering, for example, workflow management systems, service-oriented architectures, and data-driven approaches. In addition, he shows how standards like WfMC, SOAP, WSDL, and BPEL fit into the picture. This textbook is ideally suited for classes on business process management, information systems architecture, and workflow management. This 3rd edition contains a new chapter on business decision modelling, covering the Decision Model and Notation (DMN) standard; the chapter on process choreographies has been streamlined, and numerous clarifications have been fetched throughout the book. The accompanying website www.bpm-book.com contains further information and additional teaching material.

Critique of Forms of Life Rahel Jaeggi 2018-12-03 For liberals, the question "Do others live rightly?" seems to demand a follow-up question: "Who am I to judge?" Peaceful coexistence, in this view, is predicated on restraint from morally evaluating our peers. But Rahel Jaeggi argues that criticizing is not only valid but also useful. Moral judgment is no error—the error lies in how we go about it.

aims to provide condensed and crystallised knowledge, providing the rationale for investigations and interventions. Emergency medicine is a specialty where time and knowledge are critical factors in deciding appropriate management which could otherwise result in loss of life or limb. The challenge often is to have lucid management plans, whilst standing at the bedside of the patient. In order to address this challenge, a manuscript is needed which aims to enhance the clinical skills of the emergency physician. The objective of this book is to compile a road map for practitioners of emergency medicine, which would guide them through algorithm-based pathways. This format is distinctive by nature for its concise presentation, which facilitates easy reading and early application. Written by global experts, this book aims to be a truly international representation of emergency physicians who have come together to deliver contemporary concepts in emergency patient care.

Transforming NHS ambulance services Great Britain: National Audit Office 2011-06-10 The Department of Health has until recently been focusing on speed of response as a measure of performance of the ambulance service, rather than on clinical outcomes for patients. The ambulance service achieves high levels of public satisfaction but there are wide variations in ambulance trusts' efficiency and the NAO concludes that the system has not delivered the best value for money to date. The 8-minute response target, intended for the most seriously ill patients, is one of the most demanding in the world. However, its application has skewed ambulance trusts' approach to performance measurement

and management. The target is also applied to a much wider group of patients than intended. The report identifies various inefficiencies in the system, with cost per incident varying between £176 and £251. There is scope across the urgent and emergency care system to make more of different ways of responding to patients, such as clinical advice to callers over the phone and taking patients to minor injuries units rather than A&E departments. If all 11 trusts adopted the best practice currently being used in at least one trust, the NHS could save £165 million a year. The elements of the emergency care system are not yet fully integrated and this leads to delays in turnaround times at hospital A&Es. Over one-fifth of patient handovers take longer than the recommended 15 minutes. The new clinical quality indicators introduced from April offer the potential for a fuller measurement of performance based on outcomes.

Signalling in the Liver D. Häussinger 1998-08-31 The hepatocyte adapts its metabolic and excretory function to changes in nutrient supply, xenobiotics, cytokines and hormones, which provides a basis for the role of the liver in the maintenance of the body's homeostasis. Such adaptations of hepatocellular function to the environment require not only structures for recognition of signal molecules and for the sensing of environmental alterations, but also machineries which transfer this information to intracellular effector sites. Considerable progress has been made during recent years with respect to the understanding of membrane-associated receptor systems and the molecular mechanisms by which signals are transduced from these receptors to the effector sites inside the cell, i.e. the nucleus and other organelles, the cytoskeleton and various enzymes. A complex signal transduction network involving a coordinated action of a variety of protein kinase and phosphatase cascades has been identified. Such signalling events are not only important for the understanding of the physiological regulation of liver cell function, but also provide new pathophysiological and therapeutic aspects. This book, the proceedings of a Falk Workshop on 'Signalling in the Liver' (Part IV of the Liver Week Freiburg 1997) held in Freiburg, Germany, October 6, brings together an international forum of experts in both basic science and clinical applications.
