Music and Disorders of Consciousness: Emerging Research, Practice and Theory Wendy L. Magee 2017-02-28 Music processing in severely brain-injured patients with disorders of consciousness has been an emergent field of interest for over 30 years, spanning the disciplines of neuroscience, medicine, the arts and humanities. Disorders of consciousness (DOC) is an umbrella term that encompasses patients who present with disorders across a continuum of consciousness including people who are in a coma, in vegetative state (VS)/have unresponsive wakefulness syndrome (UWS), and in minimally conscious state (MCS). Technological developments in recent years, resulting in improvements in medical care and technologies, have increased DOC population numbers, the means for investigating DOC, and the range of clinical and therapeutic interventions under validation. In neuroimaging and behavioural studies, the auditory

modality has been shown to be the most sensitive in diagnosing awareness in this complex population. As misdiagnosis remains a major problem in DOC, exploring auditory responsiveness and processing in DOC is, therefore, of central importance to improve therapeutic interventions and medical technologies in DOC. In recent years, there has been a growing interest in the role of music as a potential treatment and medium for diagnosis with patients with DOC, from the perspectives of research, clinical practice and theory. As there are almost no treatment options, such a non-invasive method could constitute a promising strategy to stimulate brain plasticity and to improve consciousness recovery. It is therefore an ideal time to draw together specialists from diverse disciplines and interests to share the latest methods, opinions, and research on this topic in order to identify research priorities and progress inquiry in a coordinated way. This Research Topic aimed to bring together specialists from diverse disciplines involved in using and researching music with DOC populations or who have an interest in theoretical development on this topic. Specialists from the following disciplines participated in this special issue: neuroscience; medicine; music therapy; clinical psychology; neuromusicology; and cognitive neuroscience.

America's Forgotten Pandemic Alfred W. Crosby 2003-07-21 Between August 1918 and March 1919 the Spanish influenza spread worldwide, claiming over 25 million lives - more people than perished in the fighting of the First World War. It proved fatal to at least a half-million Americans. Yet, the Spanish flu pandemic is largely forgotten today. In this vivid narrative, Alfred W. Crosby recounts the course of the pandemic during the panic-stricken months of 1918 and 1919, measures its impact on American society, and probes the curious loss of national memory of this cataclysmic event. This 2003 edition includes a preface discussing the then recent outbreaks of diseases, including the Asian flu and the SARS epidemic.

Storying Later Life Gary Kenyon 2010-12-20 In its brief but vigorous history, gerontology has spawned a broadening range of specializations. One of the newest of such specializations is narrative gerontology, so named for its emphasis on the biographical, or inside, dimensions of the experience of aging. Telling stories about our world, our relationships, and ourselves is fundamental to how we make meaning. Everything from our history to our religion and our memories to our emotions is linked to the tales we tell ourselves, and others, about where we have come from and where we are going. They are central to who we are. The biographical side of human life is every bit as critical to fathom as the biological side, if we seek a more balanced, positive, and optimistic perspective on what aging is about; if we would honor the dignity and complexity, the humanity and uniqueness of the lives of older persons, no matter what their health or economic standing. In this respect, a narrative approach is particularly suited to the exploration of such topics as meaning, spirituality, and wisdom, and the connections they share. This volume reflects a selection of new directions and insights, and constitutes a general broadening and deepening of narrative gerontology, exploring its implications for theory and research in the field of aging, and for the quality of life of older adults themselves. Such deepening indicates a greater refinement of thought, method, and intervention. The evolution of narrative gerontology is also evidenced by a significant increase in the number of faculty and graduate students engaged in research in this area, as well as by increasing collaboration among researchers, practitioners, and administrators in applying narrative insights to contexts such as long term care - indeed, healthcare in general. These initiatives have given rise to the phrase, "narrative care as core care".

Handbook Integrated Care Volker Amelung 2017-06-30 This handbook gives profound insight into the main ideas and concepts of integrated care. It offers a managed care perspective with a focus on patient orientation, efficiency, and

quality by applying widely recognized management approaches to the field of health care. The handbook also provides international best practices and shows how integrated care does work throughout various health systems. The delivery of health and social care is characterised by fragmentation and complexity in most health systems throughout the world. Therefore, much of the recent international discussion in the field of health policy and health management has focused on the topic of integrated care. "Integrated" acknowledges the complexity of patients' needs and aims to meet it by taking into account both health and social care aspects. Changing and improving processes in a coordinated way is at the heart of this approach.

Theorien des Alterns; sozio-ökonomische Lage und Ungleichheiten; seelische und körperliche Gesundheit; soziale Netzwerke und gesellschaftliche Teilhabe.
