Critical Issues in Obstetrics - ECAB Prakash Trivedi 2009-09-15 Globally, pregnancy and childbirth are periods of high morbidity and mortality for women. The key to reducing the risks associated with pregnancy and childbirth is early recognition and provision of high quality care. The aims of critical care issues' management are broad, the need to address the defects in conceiving followed by early recognition, prevention, and management of preterm births and threatened miscarriages along with studying the essential factors responsible for the same. Infertility has been ranked as one of the greatest sources of stress in a person's life, comparable to a somatic disease such as cancer and ranked second to that involving the death of a family member or divorce. The role of stress and immunomodulation as a causative factor for infertility has been studied in greater details in recent times due to the changing lifestyles and a relevant discussion has been provided by the author with specific considerations in the Indian clinical settings. Endometriosis is the disease of the millennium, a sticky, perplexing and unconquerable pathology, which has remained an enigma. With increased awareness about endometriosis, improved methods of diagnosis like transvaginal sonography, liberal use of laparoscopy and more frequent evaluation of CA 125, the incidence of endometriosis is rising and thus, a clear understanding of the condition with application of the various advances in the recognition and also the new management protocols being followed, are the need of the day for the practitioners across the country. The polycystic ovary syndrome (PCOS), which features amenorrhea, hirsutism, and obesity, which was initially considered a reproductive and cosmetic concern of young women of reproductive age group, has more recently been recognized to have metabolic and cardiovascular associations that make it of major consequence for women of all age groups worldwide. Keeping in mind the requirements of the society, the practitioners need to update themselves on the current approach and the wide variety of choices now available. This book encompasses the rich experience of the specialists in India who are among the stalwarts in this field.

## **WHO Recommendations for the Prevention and Treatment of Postpartum**

**Haemorrhage** World Health Organization 2012-09-26 Postpartum Haemorrhage (PPH) is commonly defined as a blood loss of 500 ml or more within 24 hours after birth. PPH is the leading cause of maternal mortality in low-income countries and the primary cause of nearly one quarter of all maternal deaths globally. Most deaths resulting from PPH occur during the first 24 hours after birth: the majority of these could be avoided through the use of prophylactic uterotonics during the third stage of labour and by timely and appropriate patient management. Improving health care for women during childbirth in order to prevent and treat PPH is an essential step towards the achievement of the Millennium Development Goals. The primary objective of this guideline therefore is to provide a foundation for the strategic policy and programme development needed to ensure the sustainable implementation of effective interventions for reducing the global burden of PPH.

Disease Control Priorities, Third Edition (Volume 2) Robert Black 2016-04-11 The evaluation of reproductive, maternal, newborn, and child health (RMNCH) by the Disease Control Priorities, Third Edition (DCP3) focuses on maternal conditions, childhood illness, and malnutrition. Specifically, the chapters address acute illness and undernutrition in children, principally under age 5. It also covers maternal mortality, morbidity, stillbirth, and influences to pregnancy and pre-pregnancy. Volume 3 focuses on developments since the publication of DCP2 and will also include the transition to older childhood, in particular, the overlap and commonality with the child development volume. The DCP3 evaluation of these conditions produced three key findings: 1. There is significant difficulty in measuring the burden of key conditions such as unintended pregnancy, unsafe abortion, nonsexually transmitted infections, infertility, and violence against women. 2. Investments in the continuum of care can have significant returns for improved and equitable access, health, poverty, and health systems. 3. There is a large difference in how RMNCH conditions affect different income groups; investments in RMNCH can lessen the disparity in terms of both health and financial risk.

**Birth Settings in America** National Academies of Sciences, Engineering, and Medicine 2020-05-01 The delivery of high quality and equitable care for both mothers and newborns is complex and requires efforts across many sectors. The United States spends more on childbirth than any other country in the world, yet outcomes are worse than other high-resource countries, and even worse for Black and Native American women. There are a variety of factors that influence childbirth, including social determinants such as income, educational levels, access to care, financing, transportation, structural racism and geographic variability in birth settings. It is important to reevaluate the United States' approach to maternal and newborn care through the lens of these factors across multiple disciplines. *Birth Settings in America: Outcomes, Quality, Access, and Choice* reviews and evaluates maternal and newborn care in the United States, the epidemiology of social and clinical risks in pregnancy and childbirth, birth settings research, and access to and choice of birth settings.
