Using Technology Tools to Innovate Assessment, Reporting, and Teaching Practices in Engineering Education Alam, Firoz 2014-01-31 Many can now conclude that utilizing educational technologies can be considered the primary tools to inspire students to learn. Combining these technologies with the best teaching and learning practices can engage in creativity and imagination in the engineering field. Using Technology Tools to Innovate Assessment, Reporting, and Teaching Practices in Engineering Education highlights the lack of understanding of teaching and learning with technology in higher education engineering programs while emphasizing the important use of this technology. This book aims to be essential for professors, graduate, and undergraduate students in the engineering programs interested learning the appropriate use of technological tools.

**Command Companion of Seamanship Techniques** David House 2007-07-11 The Command Companion of Seamanship Techniques is the latest work from the well-respected marine author, D J House. It contains all the information needed for command posts at sea. · All aspects of shipboard management are discussed, with special emphasis placed on health and safety. · Guidelines on how to respond to accidents and emergencies at sea · Contains the most recent SOLAS revisions and a discussion of marine law to keep you up to date with the latest rules and regulations. In order to aid learning, the book includes a number of worked examples in the text along with questions and answers at the end of chapters. The author tells you how to respond to accidents and emergencies at sea, in the event, for example of cargo contamination, collision, loss of stability due to cargo shift and damage due to flooding, fire plus loss of life/crew. In addition, the SOLAS revisions and a discussion of marine law is included to keep you up to date with all the latest rules and regulations. In order to aid learning, this book will include a number of worked examples in the text along with questions and answers at the end of chapters. D J House is senior lecturer in Nautical studies at the Nautical college, Fleetwood. His sea-going experience includes general cargo, reefer, bulk cargo, passenger and liner trades, underwater operations, and roll-on/roll-off ferries. He is a well-known marine author and has written Seamanship Techniques Volumes 1 and 2 (combined) and he has revised Cargo Work in the Kemp & Young series.

*BASIC MARINE ENGINEERING* Prabhu TL The deep blue ocean world has been bestowed upon men as a valuable resource. It has afforded men with a variety of benefits, including navigation, treasures buried within its waves, and petroleum or other crude fuels discovered deep beneath its surface. All of these resources are focused on a marine engineering degree in order to be exploited and utilised. The marine engineering Book focuses on educating students about ways for extracting crude oil and fossil fuels from deep beneath the seabed, navigational support for ships, off-shore reservoir extraction, ship maintenance and care, and a variety of other topics. Marine engineers extract and dig up crude oil and fossil fuels deep beneath the seabed. The

marine engineers track down ships that have lost their bearings and drag them back on course. Marine engineers play an important part in the rescue of many lives. Not to mention ship maintenance and care, which is handled by marine engineers. They look after the ship's upper body, internal machineries, electrical wiring, and propellers. This aids in maximising the performance of the ships and extending their lifespan. All of these examples demonstrate the need of a marine engineering study in today's world. As a result, a marine engineering school proves to be a godsend for men's exploitation of the ocean's blue world. Contrary to popular assumption, marine engineering is an important part of engineering for a variety of sectors. Marine engineering is frequently required by the oil and gas industry, maritime corporations, and export-import industries. Having said that, it merely implies that marine engineering supports these industries. Marine engineering benefits these industries in a variety of ways. As a result, maritime engineering is in high demand in many of these industries. Furthermore, it will maintain maritime engineering relevant for as long as it is required. Everyone understands that transportation needs to be maintained on a regular basis. They require care in the form of frequent examinations, repairs, and even a fresh coat of paint. Marine engineers will be called upon to assist with ship repairs and upkeep onboard. The upkeep of a ship is expensive, but it is necessary. Maintaining the ship is an excellent idea if you want to maintain a long-term business with regular profitability. Marine engineers are also in charge of maintaining a boat's safety. Boating accidents, such as fires, engine failures, and so forth, are rarely discussed. Boaters and ship operators frequently assume that nothing bad will happen onboard. They are, however, completely incorrect. They completely forgot that even when the boats are docked or berthed, anything can happen. As a result, having a marine engineer on board to assist with ship maintenance is ideal. As a marine engineer, you have a considerable amount of say and influence over future maritime legislation. This is primarily due to the fact that maritime engineers, for obvious reasons, know their sector better than anyone else. As a result, they are in a stronger position to advocate for better maritime legislation. A marine engineer is a relatively new engineering specialisation. Certain abilities and elements, however, can be transferred to other engineering fields. When marine engineers are laid off, their transferrable abilities have proven effective in finding new jobs in the same industry. Marine engineers, on the whole, learn distinct areas of engineering than other types of engineers. This means that when they are seeking for a new engineering career, they can switch to a different type of engineering. They simply need to upgrade themselves by upskilling in other areas of engineering. Marine engineers are beneficial in a variety of ways. They make a significant contribution to the maritime industry, which benefits a variety of other industries that rely on the water.
