**Neuroprotective Therapy for Stroke and Ischemic Disease** Paul A. Lapchak 2017-01-12 A critical and comprehensive look at current state-of-the-art scientific and translational research being conducted internationally, in academia and industry, to address new ways to provide effective treatment to victims of ischemic and hemorrhagic stroke and other ischemic diseases. Currently stroke can be successfully treated through the administration of a thrombolytic, but the therapeutic window is short and many patients are not able to receive treatment. Only about 30% of patients are "cured" by available treatments. In 5 sections, the proposed volume will explore historical and novel neuroprotection mechanisms and targets, new and combination therapies, as well as clinical trial design for some of the recent bench-side research.

### **Neuroepidemiology in Resource-Limited Areas** Ding Ding 2020-06-04

Neuroepidemiology is a branch of epidemiology involving the study of neurological disease distribution and determinants of frequency in human populations. Neuroepidemiology has been perceived for a long time as a science of incidence, prevalence, risk factors, natural history and prognosis of neurological disorders. However, the other integral part of neuroepidemiology is experimental neuroepidemiology, which is research based on clinical trials of effectiveness or efficacy of various interventions in neurological disorders. Neuroepidemiological researches have been conducted since 1960's, with the development of epidemiological methodology and advance of the clinical neurology. Most improvement of neuroepidemiology was in western countries, largely in US and European countries. This study field has been developed quite late in resourcelimited areas, where 60% of world's populations are living in. Disease burden of neurological disorders, such as stroke, epilepsy, migraine, neurodegenerated diseases (AD, PD), multiple sclerosis (MS), amyotrophic lateral sclerosis (ALS), are extremely heavy in low and middle income countries (LAMICs), especially with the increasing aging population in these regions. Because of their progressive and disabling nature, these neurological disorders have major adverse personal, social, and economic consequences. Prevention and early detection are critical, because there are no cures and the clinical diagnosis typically occurs after substantial and often irreversible neuronal loss.

*IMPACT OF PHYSICAL EXERCISE AND MEDITERRANEAN DIET PRIOR TO STROKE ON THE PROGNOSIS OF PATIENTS UNDERGOING ENDOVASCULAR TREATMENT.* Carmen Garcu00eda-Cabo Fernu00eIndez 2017 Background and Aims:Physical activity (PA) and some dietary patterns like Mediterranean Diet (MeDiet) are associated with a decreased stroke risk but there are limited data on their association with stroke characteristics and prognosis. We aimed to study the association of pre-stroke PA and adherence to MeDiet with different outcome variables in patients with acute ischemic stroke (IS) treated with endovascular therapyMethods:We included consecutive patients with IS in 12 NORDICTUS (Stroke network of North Spain) hospitals. Inclusion criteria were: MCA and/or TICA occlusion and baseline mRS 0-1. Degree of PA prior to stroke was evaluated with Spanish Short Version of the Minnesota Leisure Time Physical Activity Questionnaire and adherence to the MeDiet with PREDIMED 14-points questionnaire. Clinical, radiological and prognostic variables were prospectively collected by blind investigators.Results:From 1/15/2018 to 10/30/2018, 239 patients were included (mean age 71 years,48% women, median NIHSS 16). Low adherence to MeDiet was associated with atherothrombotic etiology. Daily intake of red wine was associated with a higher probability of complete recanalization (p=0.048). In multivariable analysis, use of olive oil as the principal source of fat was independently associated with mRS u22642 at 3 months, OR 3.2 [1.2-8.7]. Patients with a lower activity level prior to stroke (sedentary) had more frequently cardioembolic stroke and a higher incidence of symptomatic intracranial hemorrhage. No associations were found between PA or MeDiet and collateral grade, final infarct volume or mortality.Conclusions:PA and some MeDiet patterns may act as preconditioning factors improving prognosis after stroke.

*Advocacy in Neurology* Wolfgang Grisold 2019-02-21 Advocacy is a broad term that covers activities aimed at increasing attention, awareness, information, nursing, treatment, and support to improve the outcome of patients. These actions can be focused directly towards patients or indirectly via third

parties. Although advocacy is present in all medical specialties, neurology in particular finds itself in need of strong advocacy tools as the diagnosis, treatment, long-term care and associated resource, and social issues have become increasingly complex. While some physicians implicitly or explicitly act as advocates, there is a lack of holistic research in order to clarify the meaning of advocacy along with concrete methods and strategies. Advocacy in Neurology provides an integrated approach to the concept of advocacy in neurology. Structured in five sections, the book begins by explaining the term "advocacy" in general before elaborating on the areas of interest within neurology. The text goes on to offer concrete strategies and tools for clinicians to deploy advocacy in their daily work, and then discusses specific neurological diseases to point out and explain where advocacy is, or could be, beneficial. The book ends with an outlook, presentation of results, and an ending conclusion. Advocacy in Neurology offers a practical perspective on advocacy activities in neurology, aiming to show when and why they are important for neurology.

Moyamoya Disease Update Byung-Kyu Cho 2010-02-26 Moyamoya disease (MMD) was first reported as a new entity among vascular disorders in 1957. Named for the abnormal vascular networks found around the occluded distal internal carotid artery, it is the most common pediatric cerebrovascular disease in East Asia. In recent years large amounts of data on MMD have been collected and important investigations have been carried out in Japan and Korea, even as the pathophysiology of the disease remains to be discovered. This monograph covers a diversity of topics and presents a systematic compilation of the data and current status of MMD in clinical practice and basic research. With contributions by more than 70 authors, the book includes sections on genetics, computational analysis of hemodynamic shear stress, new imaging techniques, and endovascular treatment of MMD, along with practical applications and future directions for gene and stem cell therapies. For neurosurgeons as well as neurologists and pediatricians, this volume will help lead to more efficient and informed management of MMD.

**Stroke Genetics** Hugh S. Markus 2003 Stroke is a major cause of death and the major cause of adult neurological disability in most of the world. Despite its importance on a population basis, research into the genetics of stroke has lagged behind that of many other disorders. However, the situation is now changing. An increasing number of single gene disorders causing stroke are being described, and there is growing evidence that polygenic factors are important in the risk of apparently "sporadic" stroke. Stroke Genetics provides an up-to-date review of the area, suitable for clinicians treating stroke patients, and both clinical and non-clinical researchers in the field of cerebrovascular disease. The full range of monogenic stroke disorders causing cerebrovascular disease, including ischaemic stroke, intracerebral haemorrhage, aneurysms and arteriovenous malformations, are covered. For each, clinical features, diagnosis, and genetics are described. Increasing evidence suggest that genetic factors are also important for the much more common multifactorial stroke; this evidence is reviewed along with the results of genetic studies in this area. Optimal and novel strategies for investigating multifactorial stroke, including the use of intermediate phenotypes such as intima-media thickness and MRI detected small vessel disease are reviewed. The book concludes by describing a practical approach to investigating patients with stroke for underlying genetic disorders. Also included is a list of useful websites.

Digital Humour in the Covid-19 Pandemic Shepherd Mpofu 2021-10-21 Digital humour in the COVID-19 pandemic: Perspectives from the Global South offers a groundbreaking intervention on how digital media were used from below by ordinary citizens to negotiate the global pandemic humorously. This book considers the role played by digital media during the pandemic, and indeed in the socio-political life of the Global South, as indispensable and revolutionary to human communication. In many societies, humour not only signifies laughter and frivolity, but acts as an important echo that accompanies, critiques, questions, disrupts, agitates and comments on societal affairs and the human condition. This book analyses citizens' use of social media and humour to mediate the pandemic in a diverse range of countries, including Brazil, India, Kenya, Nigeria, South Africa and Zimbabwe. The book will appeal to academics and students of media and communication studies, political studies, rhetoric, and to policy makers.
