At the same time, the prevalence of developmental disabilities has increased to 1 in every 6 children. Early identification of developmental delays is critical, and more than half of all American parents do not know the warning signs. This work can help occupational therapy practitioners, as well as those who manage, reimburse, or set policy regarding occupational therapy services, understand the contribution of occupational therapy in evaluating and serving young children. This guideline can also serve as a resource for parents, school administrators, educators, and other early childhood staff.

They can be a useful tool for improving the quality of health care, enhancing consumer satisfaction, promoting appropriate use of services, and reducing costs. Using an evidence-based perspective and key concepts from the Occupational Therapy Practice Framework, this guideline provides an overview of the occupational therapy process for children and adolescents with autism spectrum disorders (ASD), the prevalence of which is increasing rapidly in the United States. It defines the occupational therapy domain, process, and interventions--including sensory integration and sensory-based interventions, relationship-based interventions, school-based programs, social skills interventions, and comprehensive behavioral interventions--that occur within the boundaries of acceptable practice.

The Out-of-Sync Child Carol Stock Kranowitz 2006-04-04 The groundbreaking book that explains Sensory Processing Disorder (SPD)--and presents a drug-free approach that offers hope for parents--now revised and updated. Does your child exhibit... Over-responsivity--or under-responsivity--to touch or movement? A child with SPD may be a "sensory avoider," withdrawing from touch, refusing to wear certain clothing, avoiding active games--or he may be a "sensory disregarder," needing a jump start to get moving. Over-responsivity--or under-responsivity--to sounds, sights taste, or smell? She may cover her ears or eyes, be a picky eater, or seem oblivious to sensory cues. Cravings for sensation? The "sensory craver" never gets enough of certain sensations, e.g., messy play, spicy food, noisy action, and perpetual movement. Poor sensory discrimination? She may not sense the difference between objects or experiences--unaware of what she's holding unless she looks, and unable to sense when she's falling or how to catch herself. Unusually high or low activity level? The child may be constantly on the go--wearing out everyone around him--or move slowly and tire easily, showing little interest in the world. Problems with posture or motor coordination? He may slouch, move awkwardly, seem careless or accident-prone. These are often the first clues to Sensory Processing Disorder--a common but frequently misdiagnosed problem in which the central nervous system misinterprets messages from the senses. The Out-of-Sync Child offers comprehensive, clear information for parents and professionals--and a drug-free treatment approach for children. This revised edition includes new sections on vision and hearing, picky eaters, and disorders such as autism, among other topics.
