Handbook of Seafood İsmail Yüksel ç 2016-09 Seafood and related products have an important place in the human diet; it provides for the protein needed and has a nutritional composition that has favorable health impacts on human beings. Considering the rapid increase in the world population and the demand in terms of protein needs that are provided by seafood, the necessary need to assure the quality and safety of seafood products has been prioritised. Due to nutritional composition, neutral pH, high moisture content, weak connective tissue and living environment (fresh and seawater), seafood is very perishable. Maintaining the quality and safety of seafood needs higher attention compared to other food products. This handbook compiles recent methods and applications, as well as technologies utilised to guarantee the quality and safety of various types of seafood from harvesting to the retail level. The status of emerging and hurdle technology applications, genomic, mathematical and computer-based methods, quality economics together with chemical, sensory and microbiological changes, and quality/safety of seafood products are reviewed and discussed in this book. The emphasis on less-known or under-valued species from different locales was intentional. This handbook is an abridged, streamlined but relatively comprehensive reference for food engineers and technologists, producers from the industry, and undergraduate and graduate students studying this field of academia.

Clear, concise coverage helps you respond quickly when presented with diseases that could potentially spread between patients, clients, and staff in the veterinary clinic. Each disease entry begins with a chart of its potential morbidity (the rate of incidence of a disease) and mortality (death rate), giving you at-a-glance access to the chance of contracting the disease and the severity of the disease if contracted. Clinically relevant coverage includes information on the etiology (bacterial, viral, parasitic, etc.), most common nonhuman hosts, transmission modes, course of the disease, clinical signs in animals and humans, diagnostic tests, prevention, and general advice. Essential information on preventing the spread of disease helps you educate clients about how to protect themselves and their animals from zoonoses. Feedback in Higher and Professional Education David Boud 2013 Learners complain that they do not get enough feedback, and educators resent that although they put considerable time into generating feedback, students take little notice of it. Both parties agree that it is very important. *Feedback in Higher and Professional Education* explores what needs to be done to make feedback more effective. It examines the problem of feedback and suggests that there is a lack of clarity and shared meaning about what it is and what constitutes doing it well. It argues that new ways of thinking about feedback are needed. There has been considerable development in research on feedback in recent years, but surprisingly little awareness of what needs to be done to improve it and good ideas are not translated into action. The book provides a multi-disciplinary and international account of the role of feedback in higher and professional education. It challenges three conventional assumptions about feedback in learning: That feedback constitutes one-way flow of information from a knowledgeable person to a less knowledgeable person. That the job of feedback is complete with the imparting of performance-related information. That a generic model of best-practice feedback can be applied to all learners and all learning situations. It seeking a new approach to feedback, it proposes that it is necessary to recognise that learners need to be much more actively involved in seeking, generating and using feedback. Rather than it being something they are subjected to, it must be an activity that they drive.
