Introductory Transport Phenomena R. Byron Bird 2015-02-13 *Introductory Transport Phenomena* by R. Byron Bird, Warren E. Stewart, Edwin N. Lightfoot, and Daniel Klingenberg is a new introductory textbook based on the classic Bird, Stewart, Lightfoot text, *Transport Phenomena*. The authors' goal in writing this book reflects topics covered in an undergraduate course. Some of the rigorous topics suitable for the advanced students have been retained. The text covers topics such as: the transport of momentum; the transport of energy and the transport of chemical species. The organization of the material is similar to Bird/Stewart/Lightfoot, but presentation has been thoughtfully revised specifically for undergraduate students encountering these concepts for the first time. Devoting more space to mathematical derivations and providing fuller explanations of mathematical developments—including a section of the appendix devoted to mathematical topics—allows students to comprehend transport phenomena concepts at an undergraduate level.

Globalization and Ideology Manfred B. Steger 2025-02-06 This text provides the reader with a transdisciplinary, global studies perspective of the political significance of globalization as articulated in today's three main globalisms: market globalism; justice globalism; and religious globalism. *Globalization and Ideology: A Global Studies Perspective* brings together subjective and objective aspects of globalization that are usually treated separately from each other. Focusing on the transformation of the contemporary ideological landscape, the book is divided into three parts

containing an original preface and nine chapters. Collectively, the chapters respond to a broad range of questions, including: • How are political ideologies and social imaginaries being transformed in the global age? • What sorts of ideological claims are being generated by the three main globalisms? • How do these political ideas play out in concrete social, political, and cultural contexts? • How do globalisms shape urban spaces and popular images, and how, in turn, are they shaped by global ideologies? • How are traditional academic disciplines like political theory responding to global flows of ideas and theories that cut across conventional scholarly boundaries? • What does the fledgling field of global studies contribute to new forms of knowledge on these subjects? • What is the relationship between globalizing ideologies and post-9/11 'American Empire'? • Why has there been a surge of religious globalisms such as jihadist Islamism, Christian global fundamentalism, Falun Gong syncretism, and Buddhism? • Is the World Social Forum an effective site of ideological counter-production, capable of generating appealing political visions of 'another world' opposed to market globalisms? • Has the lingering Great Recession halted the worldwide ascent of neoliberalism or will it regain its former glory? • Rather than reaching the 'end of ideology', are we entering a new era of (global) ideological struggle?

Contractile Mechanisms in Muscle Gerald Pollack 2013-03-13 Prior to the emergence of the sliding filament model, contraction theories had been in abundance. In the absence of the kinds of structural and biochemical information available today, it has been a simple matter to speculate about the possible ways in which tension generation and shortening might occur. The advent of the sliding filament model had an immediate impact on these theories; within several years they fell by the wayside, and attention was redirected towards mechanisms by which the filaments might be driven to slide by one another. In terms of identifying the driving mechanism, the pivotal observation was the electron micrographic identification of cross-bridges extending from the thick filaments. It was quite naturally assumed that such bridges, which had the ability to split ATP, were the molecular motors, i.e., that they were the sites of mechanochemical transduction. Out of this presumption grew the cross-bridge model, in which filament sliding is presumed to be driven by the cyclic interaction of cross-bridges with complementary actin sites located along the thin filaments.
