Air Contamination Control in Hospitals J. Luciano 2012-12-06 This is a well conceived and executed volume detailing in close to encyclopedic proportions the question of control of air borne contamination in hospital environments. Many different application areas are described and well documented. Alternative solutions are presented in historical perspective with the necessary scientific background to provide the uninitiated an opportunity to learn not only how to solve a particular problem but more critically why one solution is preferable to another. Every clinician concerned for his patients' welfare must consider the quality of the environment within the hospital--for only there is it potentially controllable Airborne dissemination of nosocomial infections are considered generally rare today. This may be the result of improved intrahospital environmental control or better infection control techniques. If one considers airborne contamination, real or potential, as undesirable within certain areas of a hospital then proper environmental control must be included in the framework of the physical and functional structure. Often it is difficult to specify which controls are needed for a specific application. Frequently this is a problem of inadequate knowledge of the application area and not the availability of technology. Too often, in the rush to provide a solution the newest and most sophisticated equipment is chosen, installed, and found to be more than is required for the task. To avoid these

types of errors it is necessary to provide a series of alternative solutions for each problem.

**Management of Legionella in Water Systems** National Academies of Sciences, Engineering, and Medicine 2020-02-20 Legionnaires' disease, a pneumonia caused by the Legionella bacterium, is the leading cause of reported waterborne disease outbreaks in the United States. Legionella occur naturally in water from many different environmental sources, but grow rapidly in the warm, stagnant conditions that can be found in engineered water systems such as cooling towers, building plumbing, and hot tubs. Humans are primarily exposed to Legionella through inhalation of contaminated aerosols into the respiratory system. Legionnaires' disease can be fatal, with between 3 and 33 percent of Legionella infections leading to death, and studies show

the incidence of Legionnaires' disease in the United States increased five-fold from 2000 to 2017. Management of Legionella in Water Systems reviews the state of science on Legionella contamination of water systems, specifically the ecology and diagnosis. This report explores the process of transmission via water systems, quantification, prevention and control, and policy and training issues that affect the incidence of Legionnaires' disease. It also analyzes existing knowledge gaps and recommends research priorities moving forward.
